

# Development of the Z-coordinate High-Resolution Non-Hydrostatic Atmospheric Model Using the Shaved Cell Method

7th International SRNWP-Workshop  
on Non-Hydrostatic Modelling  
Bad Orb, 5-7 November 2007

Hiroe Yamazaki and Takehiko Satomura  
Division of Earth and Planetary Sciences,  
Kyoto University, Japan

# Table of Contents

## 1. Introduction

Early studies and technical issues

## 2. Model Descriptions

Governing equations and the modified shaved cell method

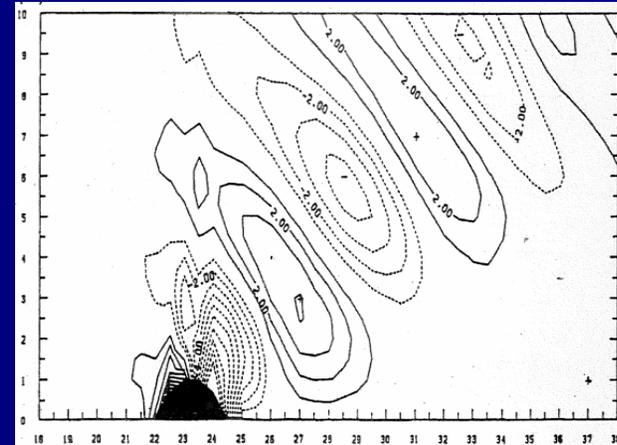

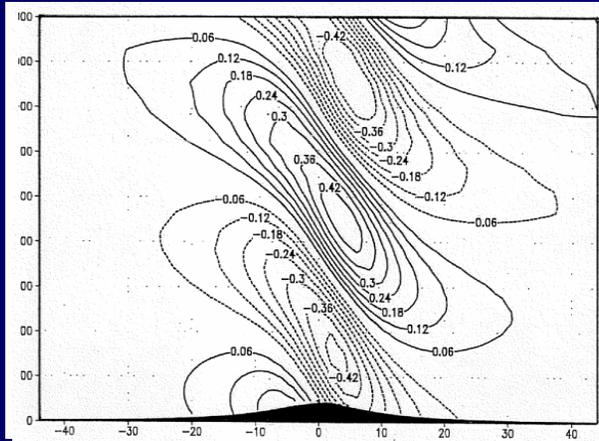

## 3. Results

Simulations of flow over both gentle and steep slopes

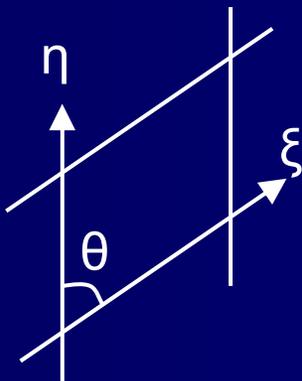

## 4. Conclusion

# 1. Introduction

- For high-resolution simulations, steep slopes are represented over complex terrain.
- The commonly used terrain following representation of topography induces large truncation errors over steep slopes (Thompson et al., 1985) .

(Satomura, 1989 )

- The steeper the slope, the larger the errors  $T$  .

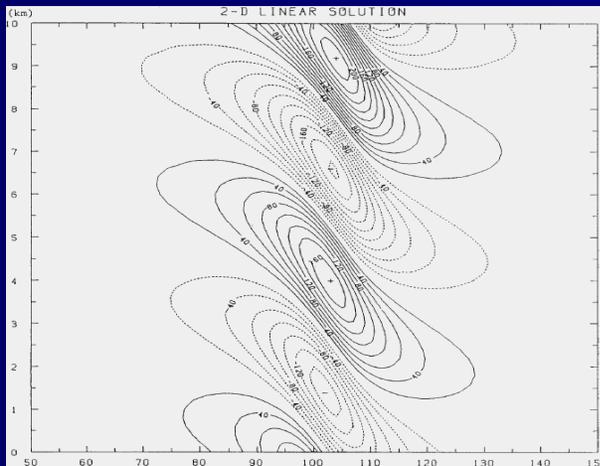

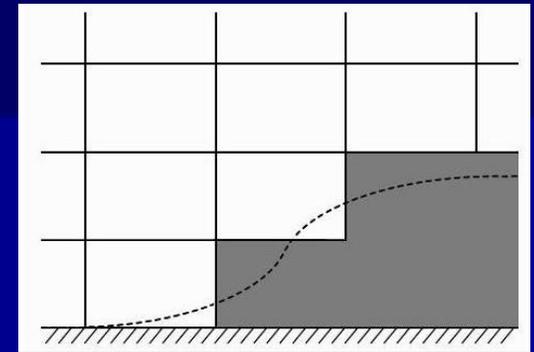

$$T \approx \frac{1}{2} \left\{ -x_{\xi\xi} f_{xx} + (y_{\eta\eta} f_{yy} - x_{\xi\xi} f_{xy}) \cot \theta \right\}$$

$T \propto \cot \theta$

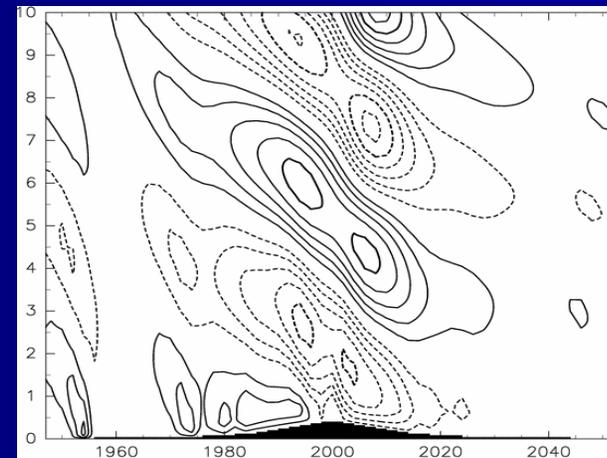

- This errors will be serious in high-resolution simulations.  
 → Other representation methods are needed !

# box cell method

- Approximating topography fitted to models grids.
  - NCEP Eta Model etc.
- Technical issues ( Gallus and Klemp,2000 )
  - This method represents topography precisely only when the resolutions are very high.
  - In particular, the step-like representation induces large errors over smooth topography.

linear theory

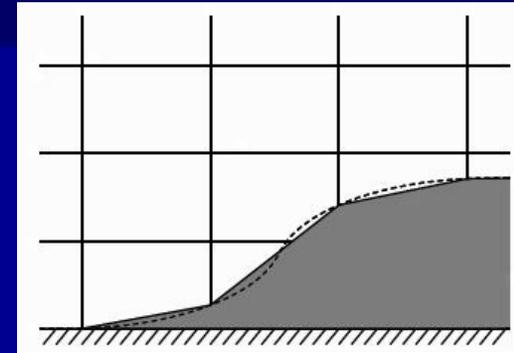

box cell model

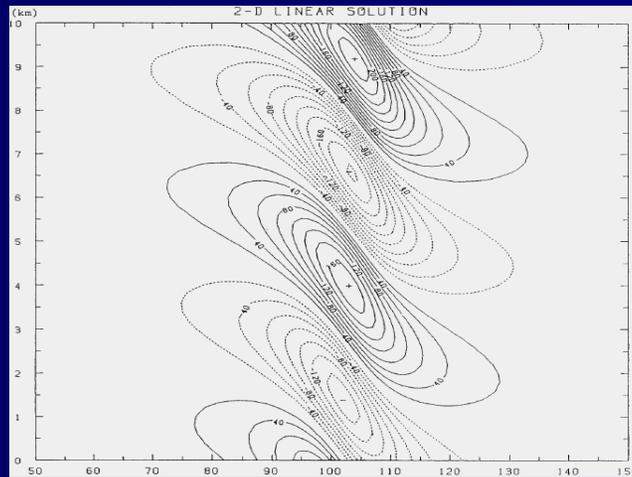

→The box cell method cannot reproduce mountain waves precisely.

# shaved cell method (Adcroft et al., 1997)

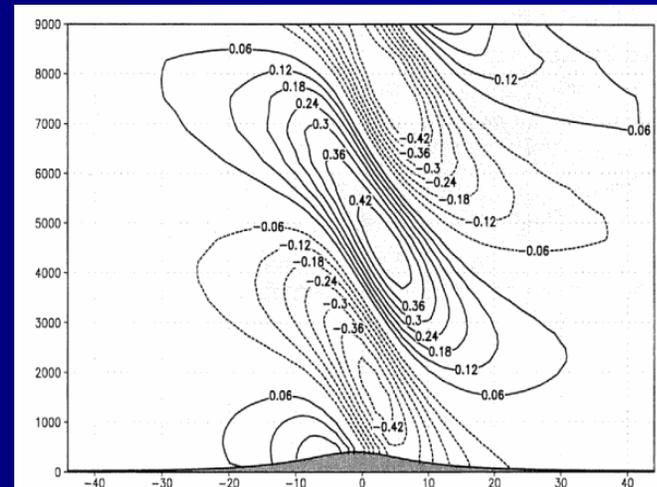

- Model cells are cut by piece wise linear topography.
  - Discretized by the Finite Volume Method
  - Small cells require small  $\Delta t$ .
- Avoiding extremely small  $\Delta t$  is the key point !

- Simulations of flow over a bell-shaped mountain (Steppeler et al., 2002)

linear theory

shaved cell model

→ The shaved cell method can precisely reproduce air flow over smooth topography.

# Our viewpoint

- Technical issues of Steppeler et al. (2002)
  1. Advective form equations are used in spite of the FVM.
    - Quasi-flux form equations are employed.
  2. Using thin-wall approximation to avoid extremely small  $\Delta t$ .
    - Small cells are combined to upper cells.

Simulations of flow over steep slopes were performed.

## 2. Model Descriptions

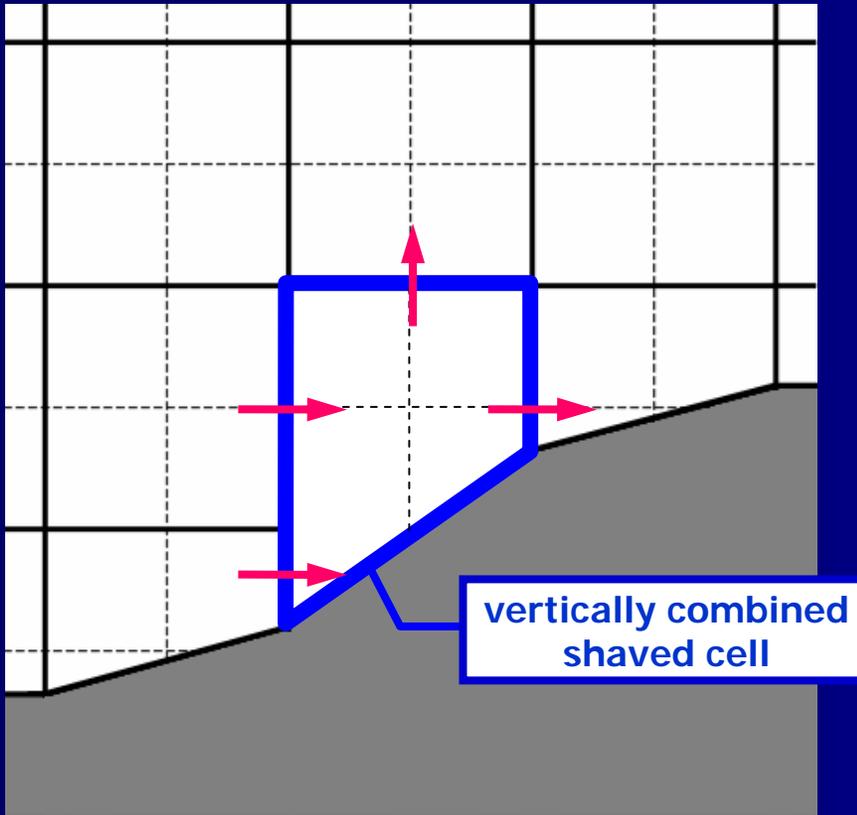

- The fully compressible equations in quasi-flux form are employed. (Satomura and Akiba, 2003)

$$\begin{aligned}\frac{\partial(\rho u)}{\partial t} + \frac{\partial(\rho u u)}{\partial x} + \frac{\partial(\rho u w)}{\partial z} &= -\frac{\partial p'}{\partial x} + DIF(\rho u) \\ \frac{\partial(\rho w)}{\partial t} + \frac{\partial(\rho w u)}{\partial x} + \frac{\partial(\rho w w)}{\partial z} &= -\frac{\partial p'}{\partial z} - \rho'g + DIF(\rho w) \\ \frac{\partial p'}{\partial t} &= -\frac{R_d \pi}{1 - R_d / C_p} \left\{ \frac{\partial(\rho \theta u)}{\partial x} + \frac{\partial(\rho \theta w)}{\partial z} + DIF(\rho \theta) \right\} \\ \frac{\partial \rho'}{\partial t} + \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho w)}{\partial z} &= 0\end{aligned}$$

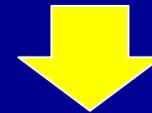

- This form does not suffer from the cancellation error due to the subtraction of hydrostatic part ( $\bar{p}$  or  $\bar{\rho}$ ) from nearly hydrostatically balanced variable ( $p$  or  $\rho$ ).
- Well suited to the Finite Volume Method in the view of conservation characteristics.

→The combination of the shaved cell method and the quasi-flux form equations is expected to achieve high-resolution and high-precision simulations.

# vertical combination of small cells

- Equations are discretized by flux exchanges.
  - Small cells require small  $\Delta t$  to satisfy the CFL condition.
- Combining cells whose areas are smaller than  $\Delta x \Delta z / 2$  to upper cells.

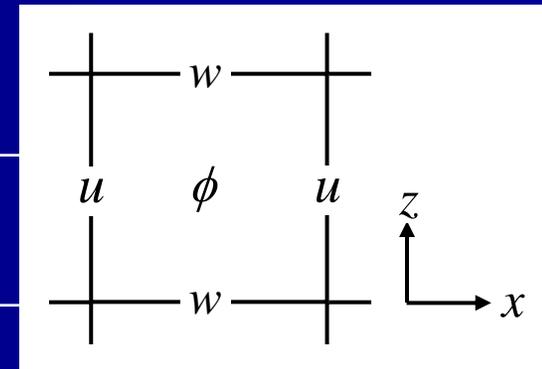

**Avoiding extremely small  $\Delta t$   
and also keeping the  
conservation characteristics.**

# Model descriptions

## ■ Dynamics

Dimension	2-D
Governing equations	Quasi-Flux Form Fully Compressible Non-Hydrostatic System
Spatial discretization Horizontal cell configuration Vertical cell configuration	Finite Volume Method Arakawa-C type Lorenz type

# 3. Results

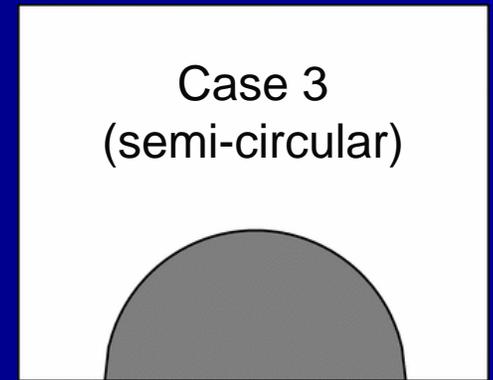

- Two-dimensional numerical simulations of flow over a mountain are performed using the developed model.
  - Constant horizontal velocity and the Brunt-Väisälä frequency are specified for each case.

- height : 100 m
- half width : 5000 m
- average slope angle : 0.57 deg.

- height : 500 m
- half width : 250 m
- average slope angle : 45 deg.

- radius : 1 km
- maximum slope angle : 90 deg.

gentle slope

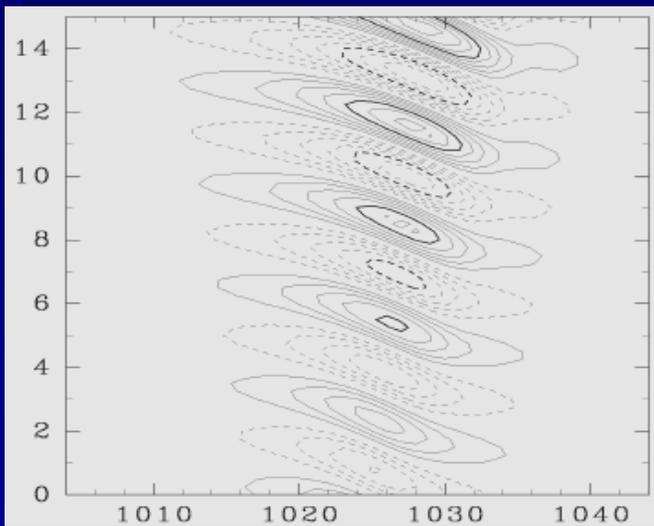

steep slope

# Results

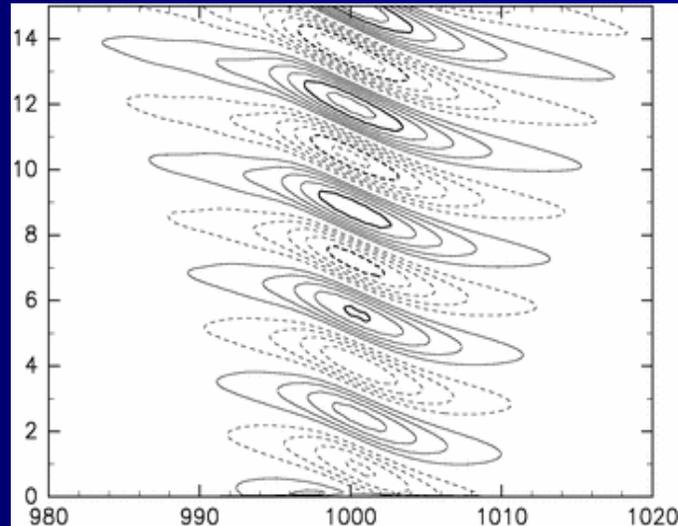

- Case 1 (  $h=100\text{m}$ ,  $a=5000\text{m}$ ,  $a * N/U=10$ ,  $t=300\text{min}$ , average slope angle  $\theta= 0.57 \text{ deg.}$  )

Case 1  
(bell-shaped)

W (contour interval=0.05m/s)

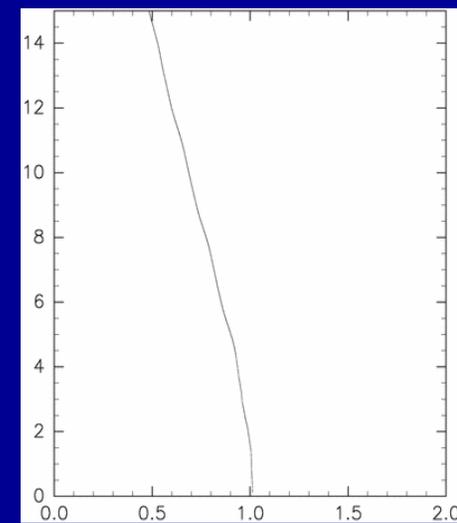

linear theory

vertically combined  
shaved cell

(  $\Delta x = 1000\text{m}$ ,  $\Delta z = 50\text{m}$  )

Normalized Flux

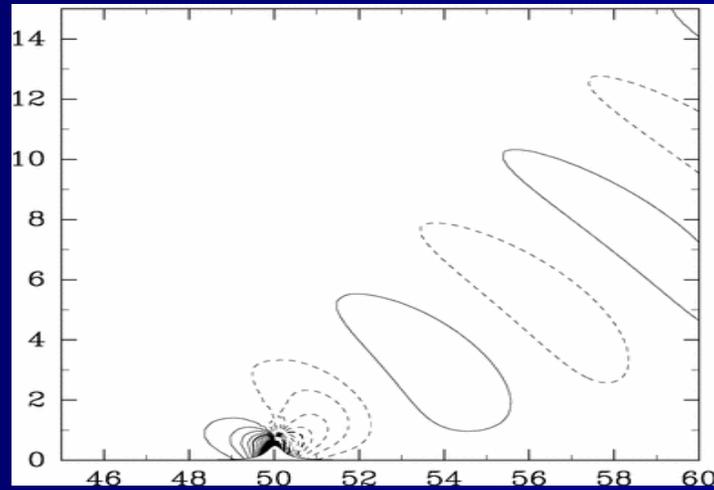

# Results

- Case 2 (  $a=500\text{m}$ ,  $h=250\text{m}$ ,  $a * N/U=0.25$ ,  $t=100\text{min}$ , average slope angle  $\theta=45\text{ deg.}$  )

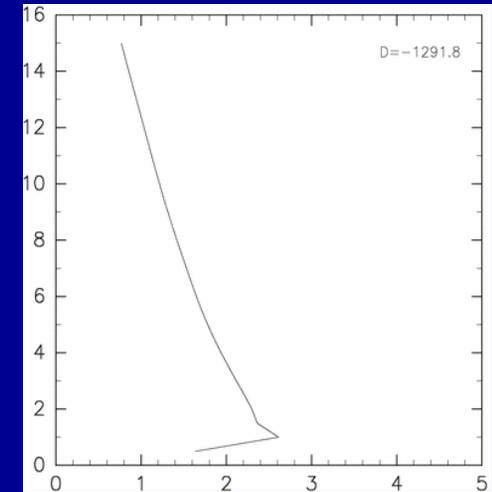

Case 2  
(bell-shaped)

W (contour interval=0.5m/s)

Normalized Flux

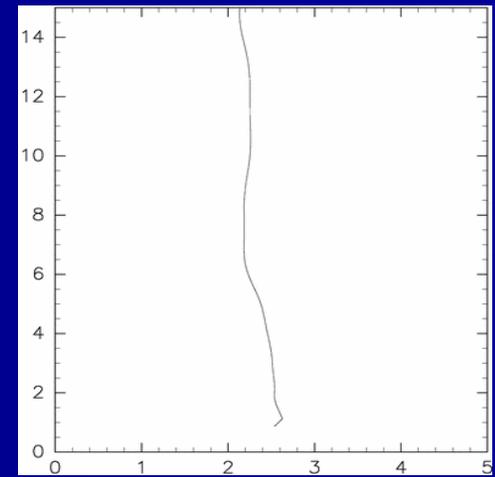

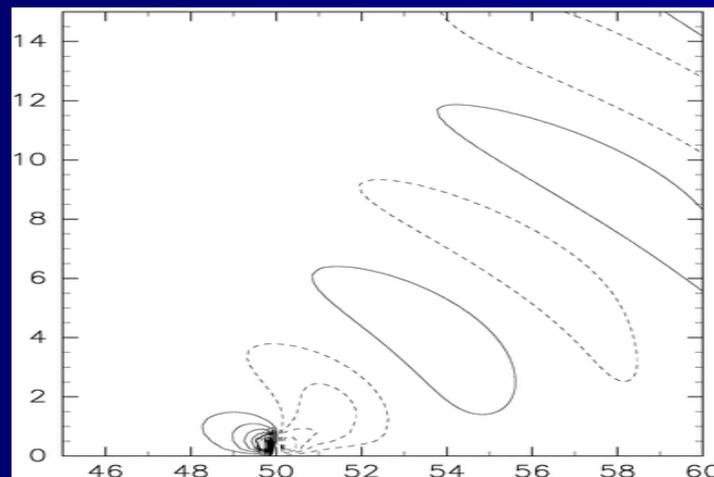

**z\*-coordinate**

(  $\Delta x = 50\text{m}$ ,  $\Delta z = 250\text{m}$  )

**vertically combined  
shaved cell**

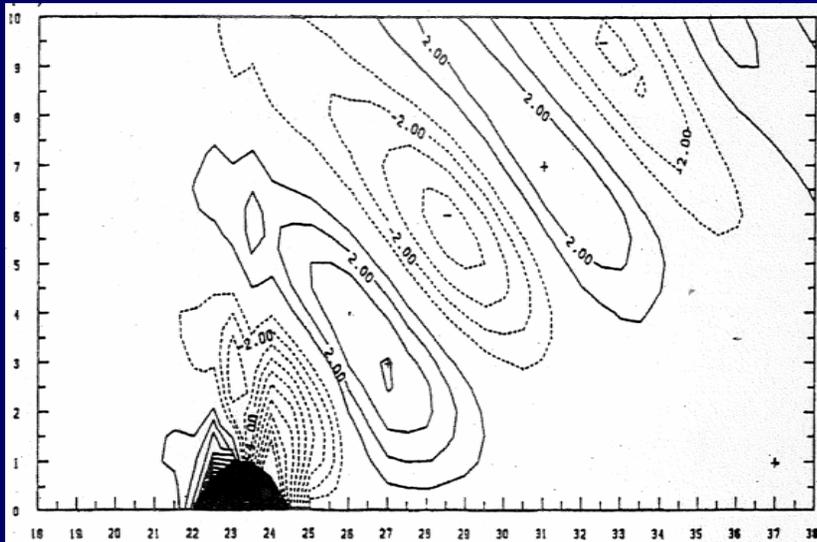

(  $\Delta x = 50\text{m}$ ,  $\Delta z = 250\text{m}$  )

# Results

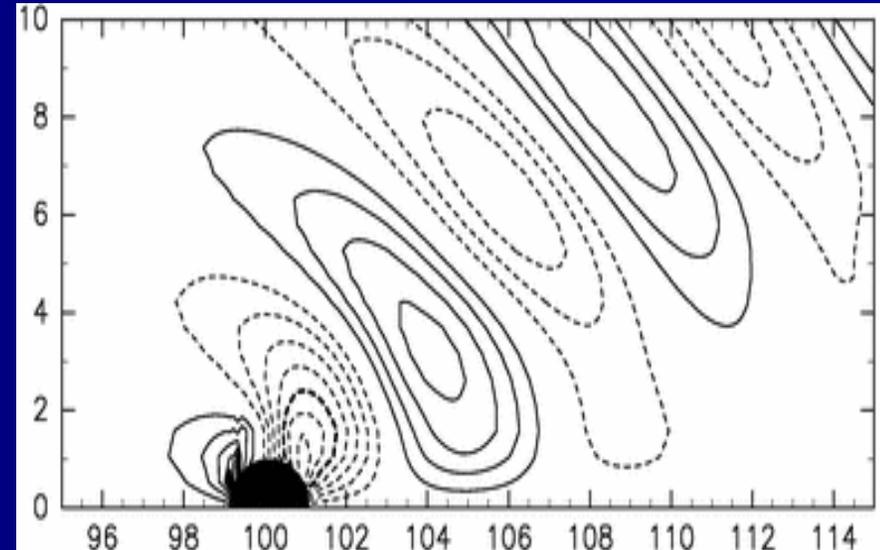

- Case 3 ( radius 1km,  $t=60\text{min}$ ,  
maximum slope angle  $\theta=90\text{ deg.}$  )

Case 3  
(semi-circular)

$z^*$ -coordinate

(  $\Delta x = 500\text{m}$ ,  $\Delta z = 500\text{m}$  )

vertically combined  
shaved cell

(  $\Delta x = 100\text{m}$ ,  $\Delta z = 500\text{m}$  )

→ The vertically combined shaved cell method can reproduce smooth and accurate mountain waves over gentle as well as steep slopes !

## 4. Conclusion

- A two-dimensional non-hydrostatic model to simulate air flow over complex terrain including steep slopes was developed.
  - The shaved cell method was implemented.
  - Small cells were combined to upper cells.
  - Quasi-flux form equations were employed.
- Two-dimensional numerical simulations of mountain waves were performed.
  - The vertically combined shaved cell method reproduced smooth and accurate mountain waves over both gentle and steep slopes.
- Future plan
  - speeding up
  - boundary layer
  - physics
  - three-dimensional modelling etc.

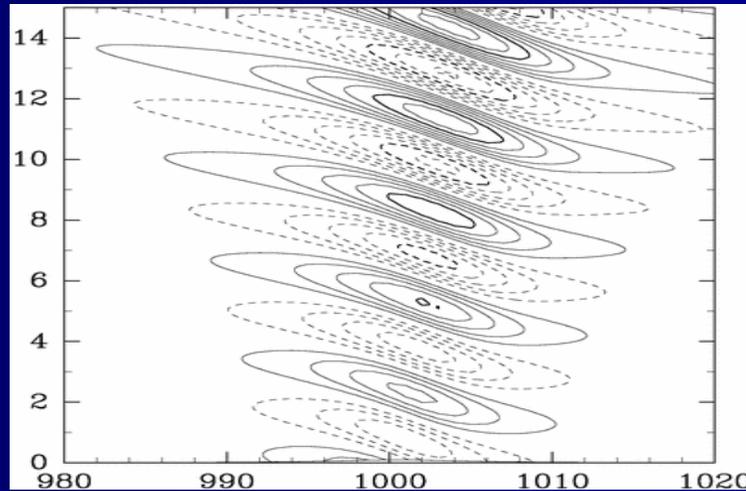

# Results

Case 1  
(bell-shaped)

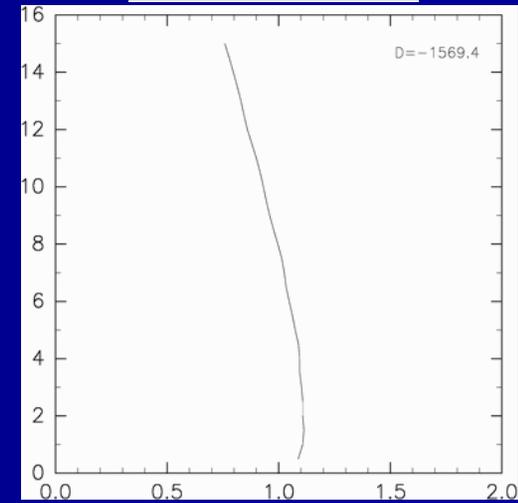

- Case 1 (  $h=5000\text{m}$ ,  $a=100\text{m}$ ,  $a * l=10$ ,  $t=300\text{Min}$ )
